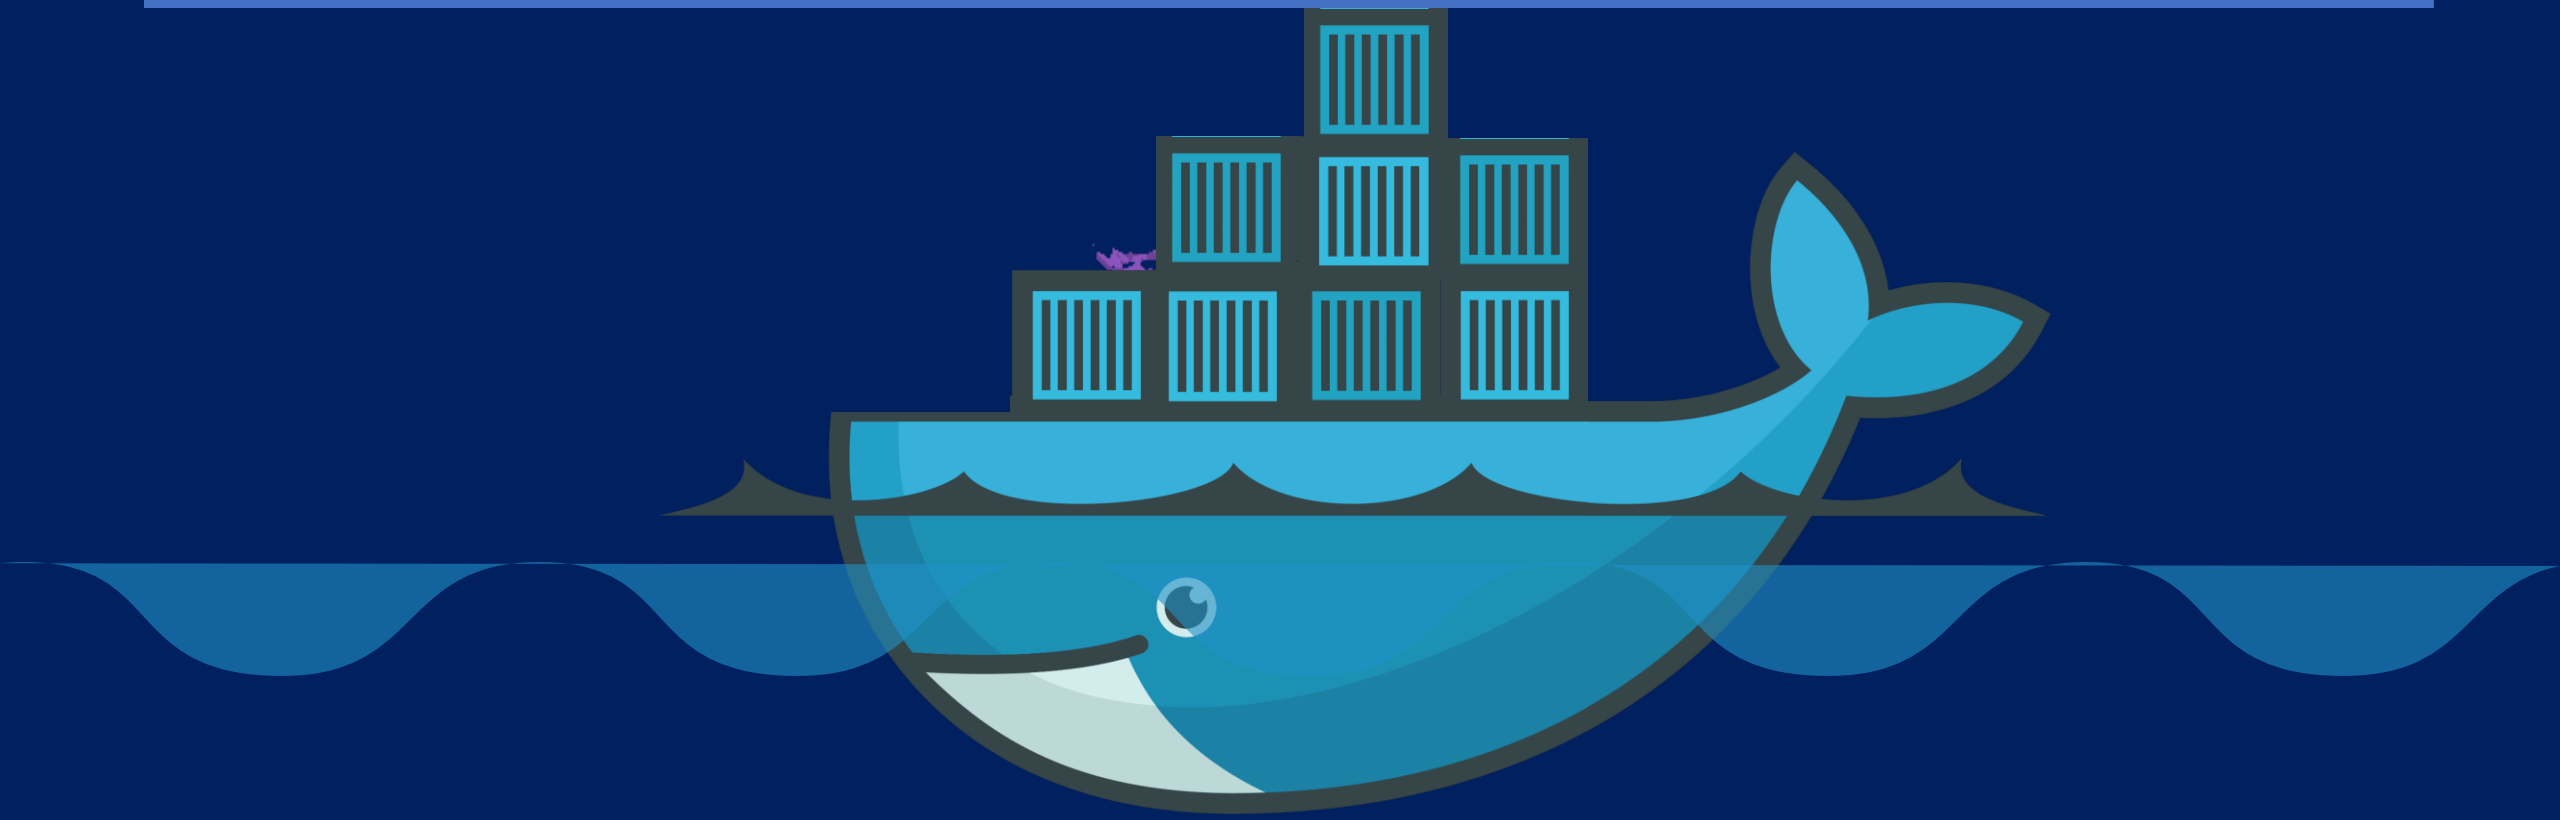
MACHINE LEARNING OPERATIONS

WEEK 11

UNLIMITED

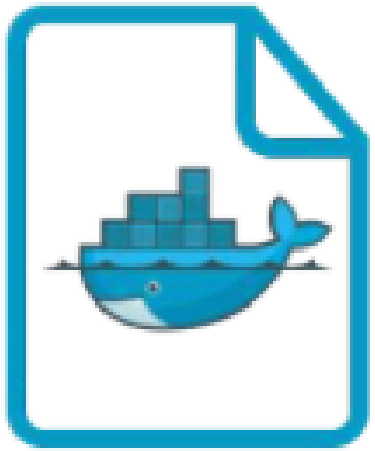
Presented by **Asst. Prof. Dr. Tuchsanai Ploysuwan**

Dockerfile and Docker Image



Dockerfile

- Dockerfile is instructions to build Docker Image
  - How to run commands
  - Add files or directories
  - Create environment variables
  - What process to run when launching container
- Result from building Dockerfile is Docker Image



Dockerfile

Sample Dockerfile

```
FROM node:14.15.0-alpine3.12
COPY . /nodejs/.
WORKDIR /nodejs
RUN npm install
ENV VERSION 1.0
EXPOSE 8081
CMD ["node", "/nodejs/main.js"]
```

OS + System Packages

Source Code

Library Dependencies

Configuration

Dockerfile reference

FROM <image:tag>	Sets the base image for subsequent instructions.
RUN <command>	Execute any commands in image.
CMD <command> <param1> <param2>	Sets the command to be executed when running the image.
LABEL <key>=<value> ...	Adds metadata to an image.
EXPOSE <port>	Informs Docker that the container listens on the specified network ports at runtime.
ENV <key> <value>	Sets the environment variable.
COPY <src> <dest>	Copies new files from source to the filesystem of the container at the path destinations.
ENTRYPOINT <command> <param1> <param2>	Command line arguments will be appended after all elements in an exec form ENTRYPOINT.
VOLUME ["/data"]	Sets mounted volumes from native host or other containers.
WORKDIR <path>	Sets the working directory for any commands.

How to create my own image?

Dockerfile

```
FROM Ubuntu

RUN apt-get update
RUN apt-get install python

RUN pip install flask
RUN pip install flask-mysql

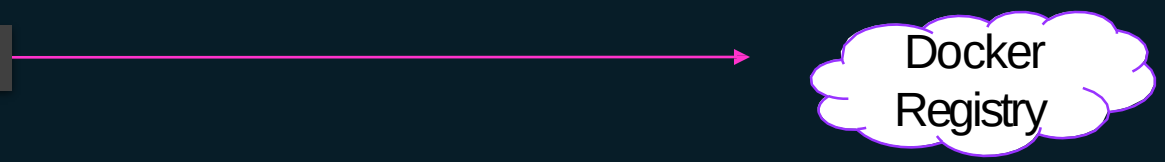
COPY . /opt/source-code

ENTRYPOINT FLASK_APP=/opt/source-code/app.py flask run
```

1. OS - Ubuntu
2. Update apt repo
3. Install dependencies using apt
4. Install Python dependencies using pip
5. Copy source code to /opt folder
6. Run the web server using “flask” command

```
docker build Dockerfile –t mmumshad/my-custom-app
```

```
docker push mmumshad/my-custom-app
```



Dockerfile

Dockerfile

```
INSTRUCTION ARGUMENT
```

Dockerfile

```
FROM Ubuntu

RUN apt-get update
RUN apt-get install python

RUN pip install flask
RUN pip install flask-mysql

COPY . /opt/source-code

ENTRYPOINT FLASK_APP=/opt/source-code/app.py flask run
```

Start from a base OS or another image

Install all dependencies

Copy source code

Specify Entrypoint

Layered architecture

Dockerfile

```
FROM Ubuntu

RUN apt-get update && apt-get –y install python

RUN pip install flask flask-mysql

COPY . /opt/source-code

ENTRYPOINT FLASK_APP=/opt/source-code/app.py flask run
```

docker build Dockerfile –t mmumshad/my-custom-app

Layer 1. Base Ubuntu Layer	120 MB
Layer 2. Changes in apt packages	306 MB

Objective

The goal of this lab is to understand:

- How `CMD` and `ENTRYPOINT` instructions define a container's default behavior.
- The difference in behavior when using them separately and together.
- How to override the default behavior defined by these instructions.

Prerequisites

- Docker installed on your machine.

Lab Setup

create directory

```
mkdir LAB0_Week11
cd    LAB0_Week11
```

git clone branch dev

```
git clone -b dev https://github.com/Tuchsanai/DevTools.git
```

```
cd DevTools/02_Docker/Week11/00_LAB_CMD_Entrypoint/
```

        }
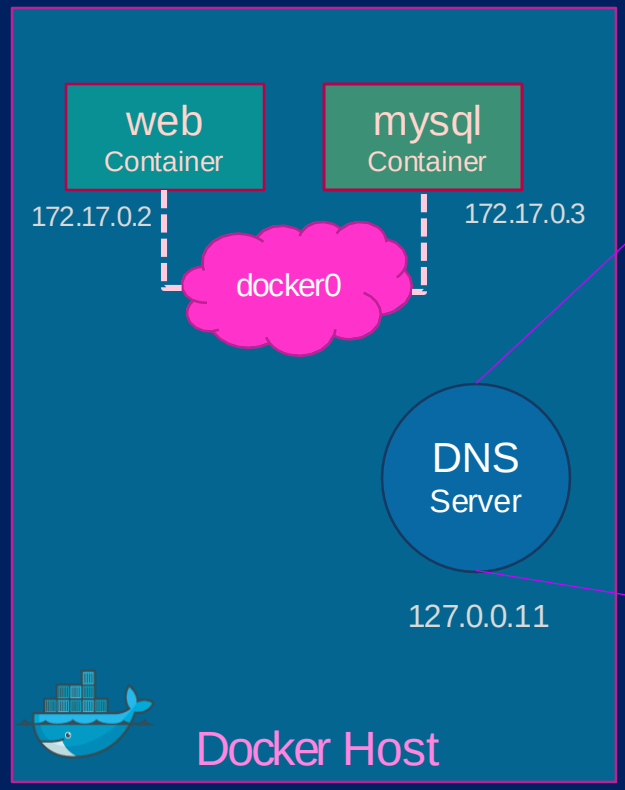
]
```

Embedded DNS

```
mysql.connect(          mysql          )
```



Host	IP
web	172.17.0.2
mysql	172.17.0.3

LAB 3:

Lab Docker Network with Subnet

This guide explains how to create a lab Docker network with a specific subnet using a busybox container.

1. Create a new Docker network named "lab_network" with a specific subnet, e.g., 192.168.100.0/24, using the following command:

```
docker network create --subnet 192.168.100.0/24 lab_network
```

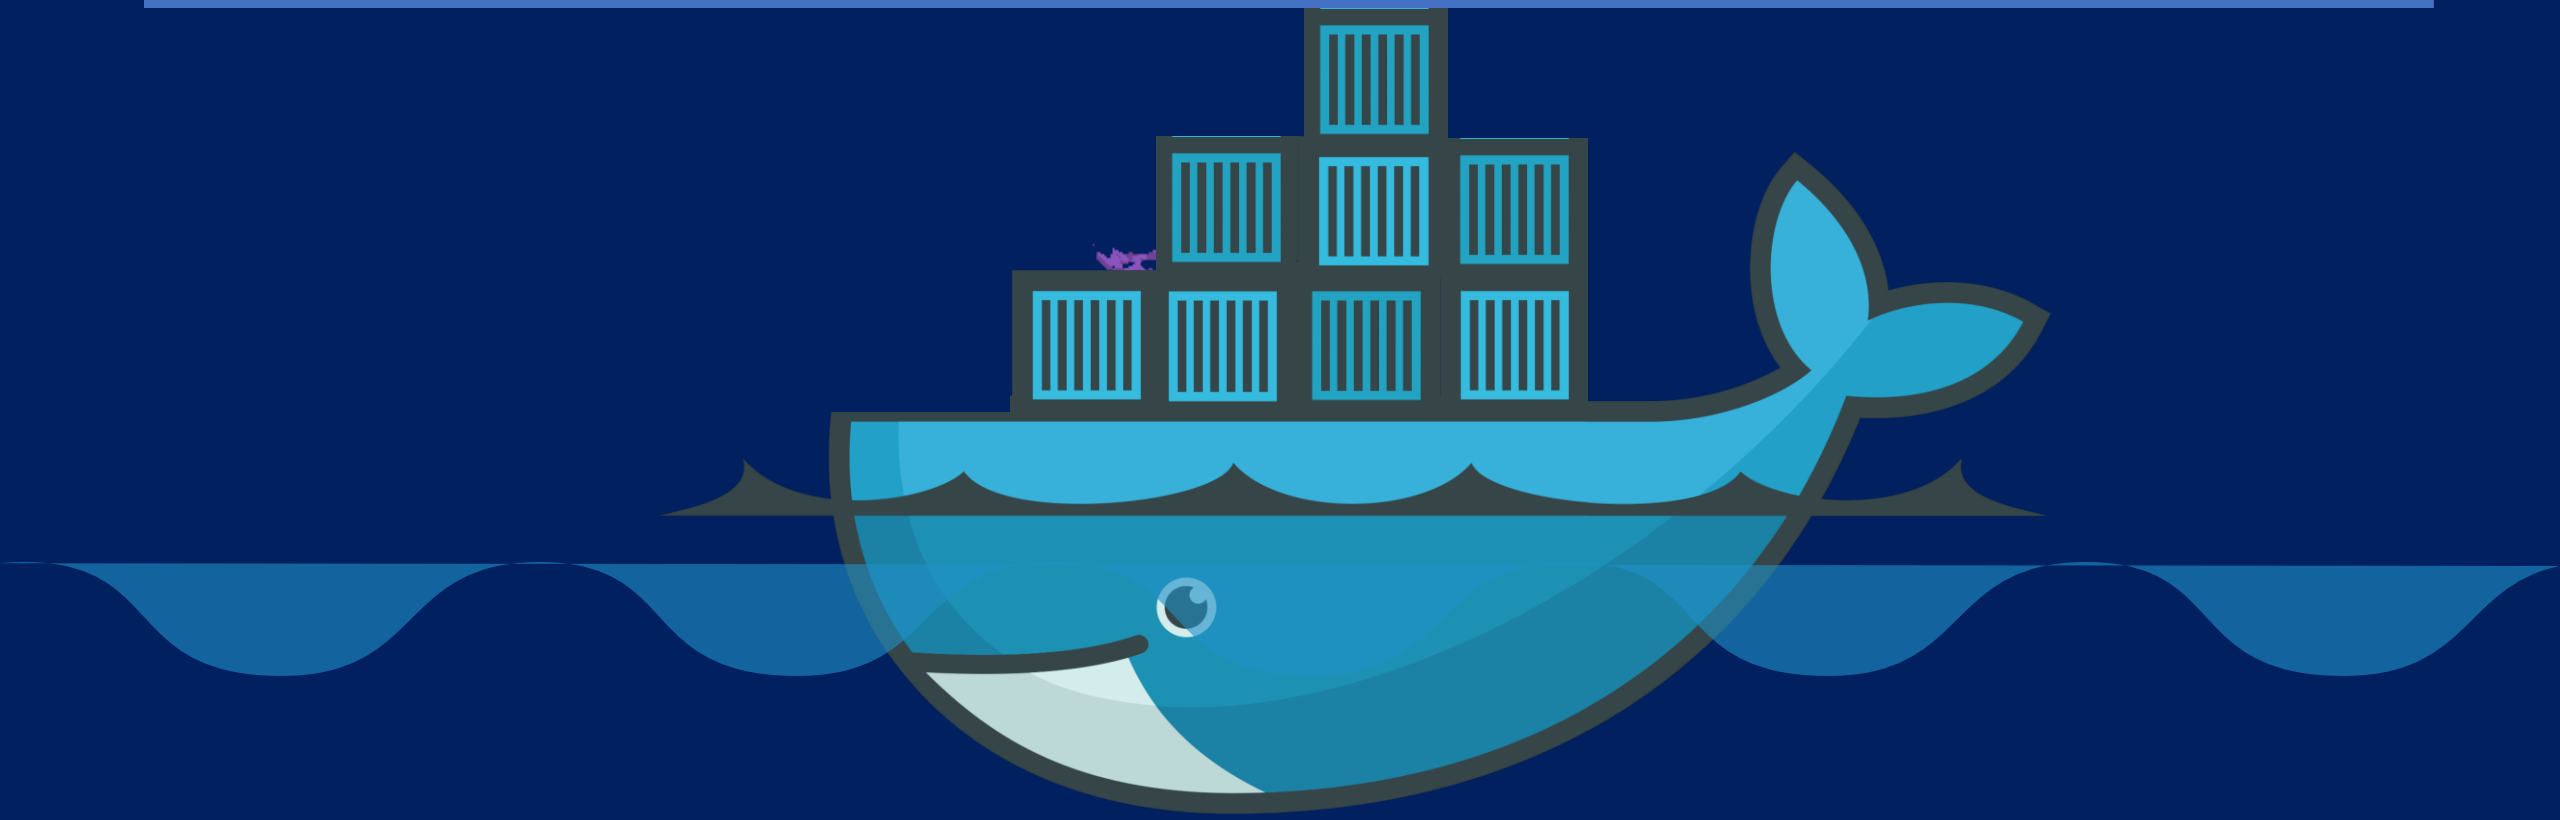
2. To confirm that the "lab_network" has been created and to view its settings, run the following command:

```
docker network inspect lab_network
```

3. Run a new container with the busybox image and connect it to the "lab_network" using the following command:

```
docker run  --name busybox_container --network lab_network busybox
```

Docker compose



Docker compose

```
docker run yourname/simple-webapp
```

```
docker run mongodb
```

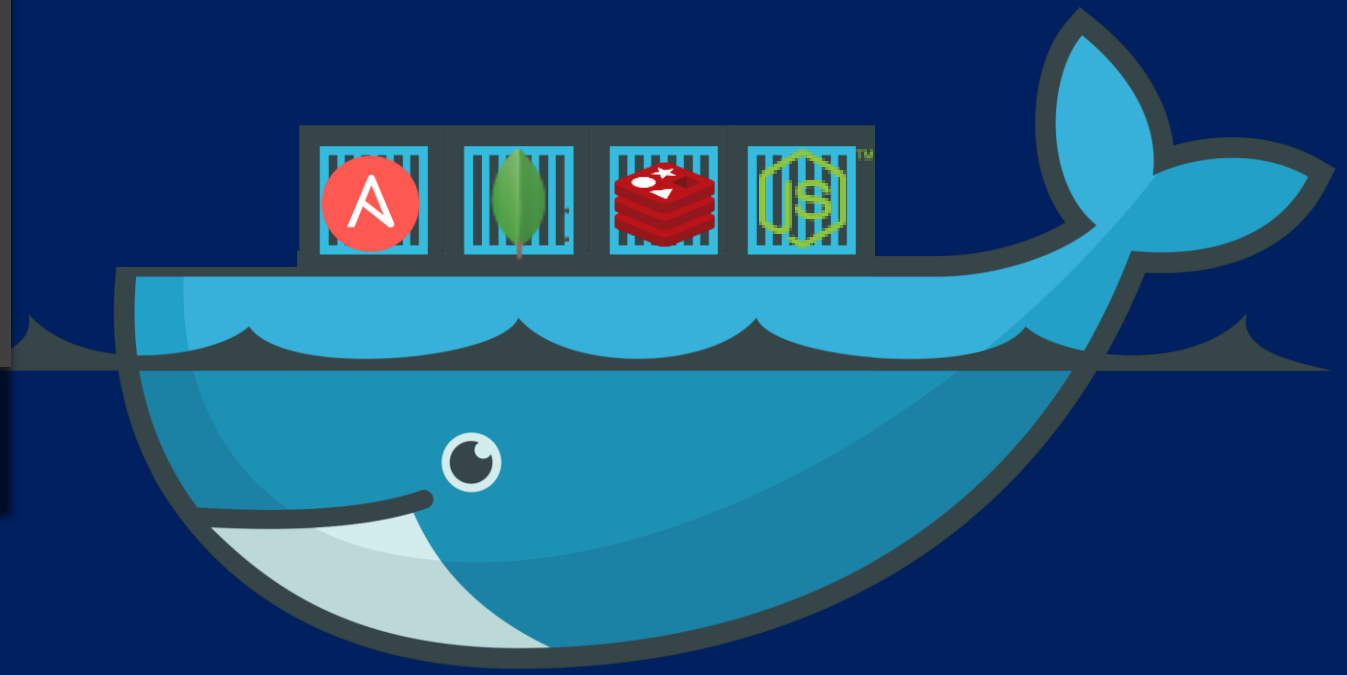
```
docker run redis:alpine
```

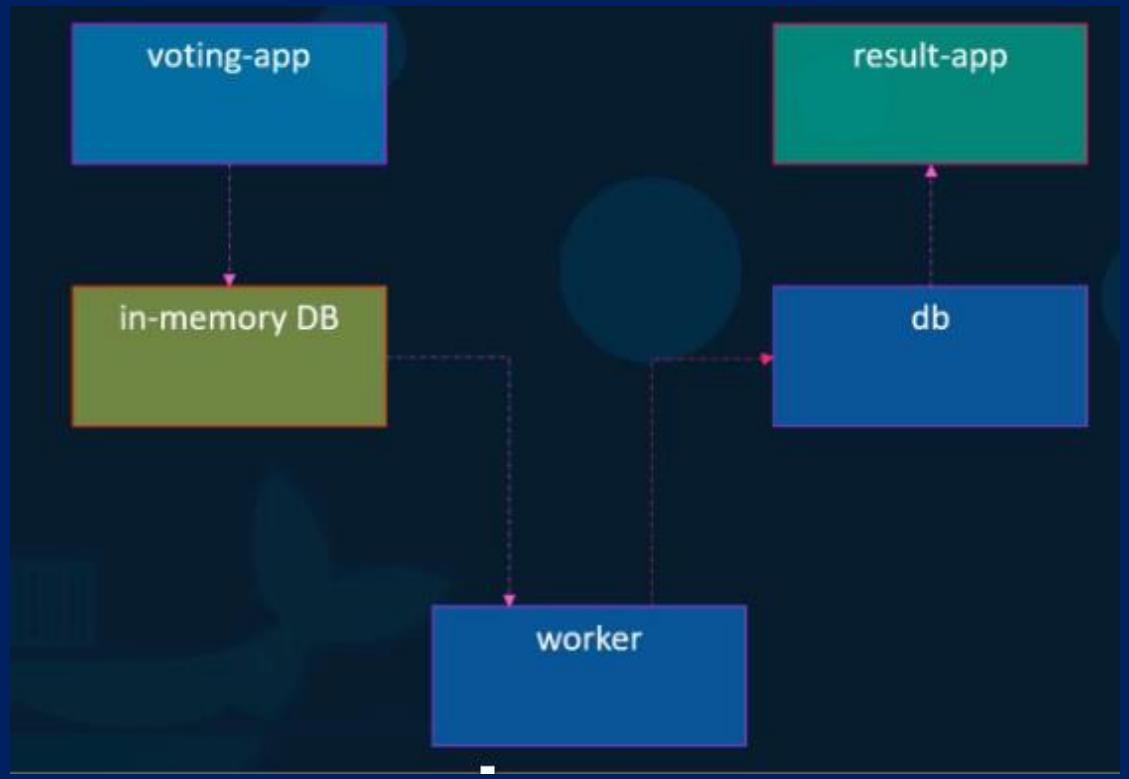
```
docker run ansible
```

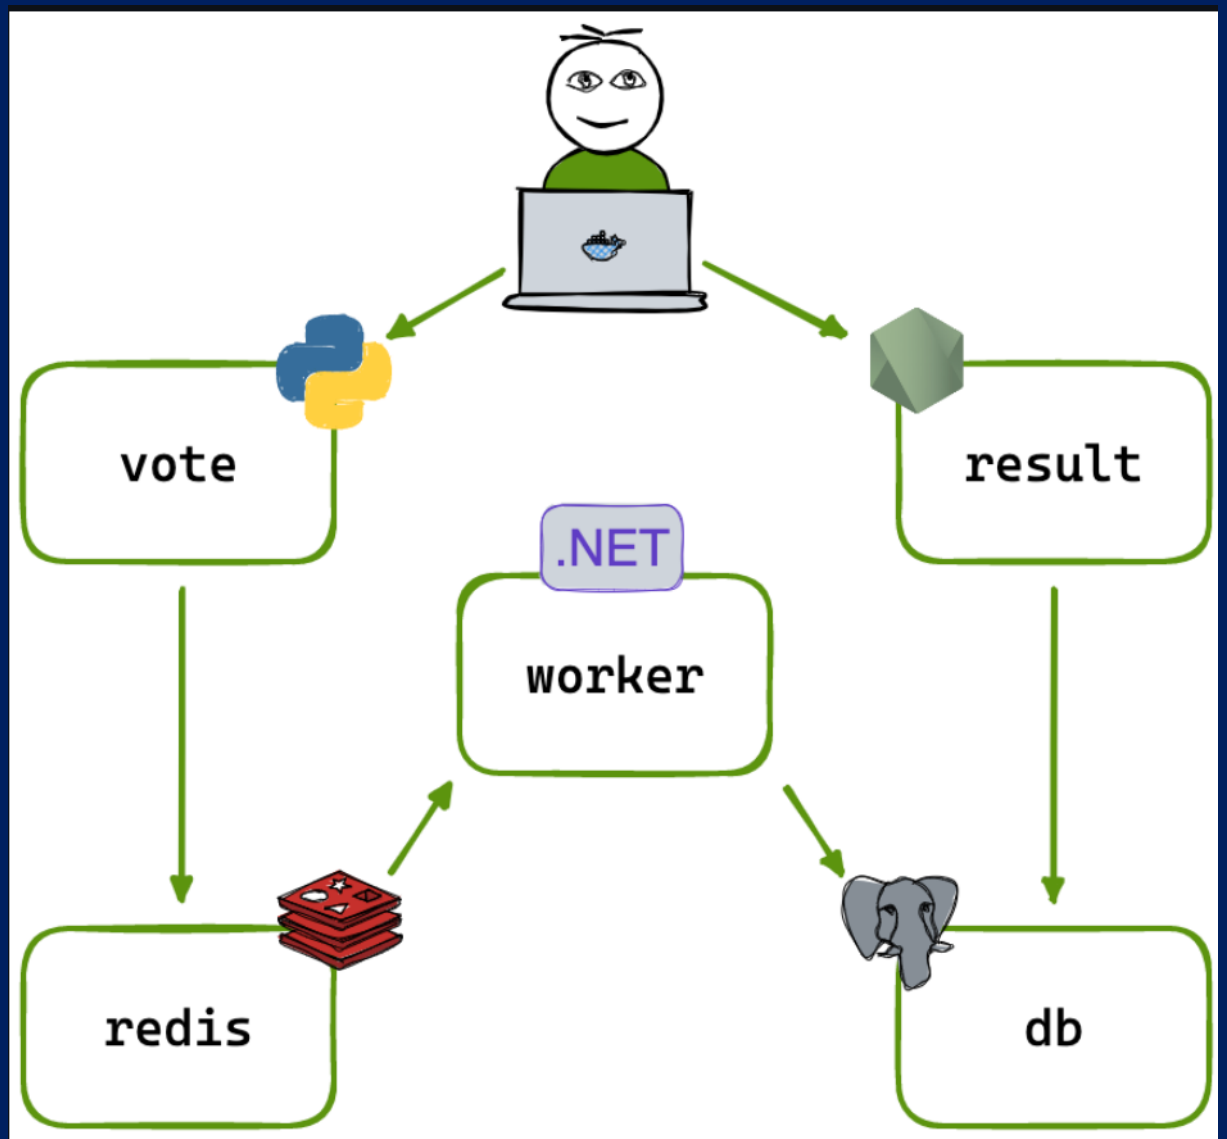
docker-compose.yml

```
services:
    web:
        image: “yourname/simple-webapp"
    database:
        image: “mongodb“
    messaging:
        image: "redis:alpine“
    orchestration:
        image:      “ansible“
```

```
docker-compose up
```







- A front-end web app in Python which lets you vote between two options
- A Redis which collects new votes
- A .NET worker which consumes votes and stores them in...
- A Postgres database backed by a Docker volume
- A Node.js web app which shows the results of the voting in real time

5
6   if ping="$(redis-cli -h "$host" ping)" && [ "$ping" = 'PONG' ]; then
7           exit 0
8   fi
9
10  exit 1
```

docker-compose up

This command is used to start the containers defined in the docker-compose.yml file. If the containers don't exist, they will be created.

```
docker-compose up
```

docker-compose down

This command is used to stop and remove the containers defined in the docker-compose.yml file.

```
docker-compose down
```

To delete all networks, images, and volumes with Docker Compose, you can use the following commands:

```
docker-compose down --rmi all --volumes --remove-orphans
```

- The --rmi all flag tells Docker to remove all images associated with the containers.
- The --volumes flag tells Docker to remove any volumes associated with the containers.
- The --remove-orphans flag tells Docker to remove any containers that were not defined in the docker-compose.yml file.

```
docker network prune
docker volume prune
```

- The second command (docker network prune) will remove any unused networks.
- The third command (docker volume prune) will remove any unused volumes.

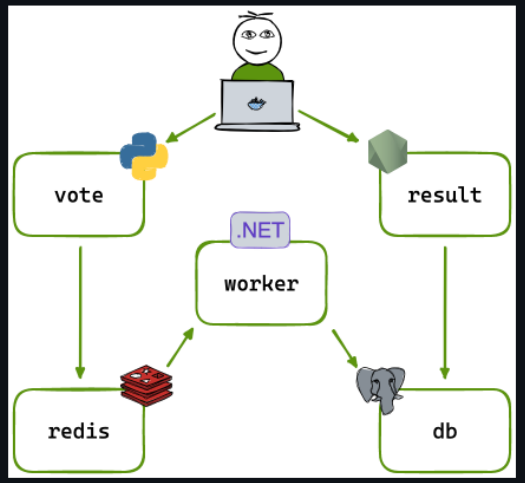
README.md

Example Voting App

A simple distributed application running across multiple Docker containers.

Getting started



- A front-end web app in Python which lets you vote between two options
- A Redis which collects new votes
- A .NET worker which consumes votes and stores them in...
- A Postgres database backed by a Docker volume
- A Node.js web app which shows the results of the voting in real time
